It provides (i) molecules structurally mimicking human CD59 carbined acid residues 42-58 (region which serves as binding site for CD59 complex interactions) when they are in a spatial orientation which can CC5 specifically bind to amino acid residues 359-384 of human C9. (ii) complex. Compounds that mimicking CD59 amino acids 359-384 when they are in a spatial orientation of the human C5b-9 complex. These mimetics CC in a spatial orientation which can promote the formation of the C5b-9 complex. Complex. Compounds that mimic CD59 can be used to increase CD59 complex. Compounds that mimic CD59 can be used to increase CD59 complex. Compounds that mimic CD59 can be used to increase CD59 complex assembly. This is especially useful in carthritis, scleroderma. Compounds that mimic C9 can be used to promote carthritis, scleroderma. Compounds that mimic C9 can be used to promote carthritis, scleroderma. Compounds that mimic C9 can be used to promote cartivation. The composition can be administered as an adjunct to tumour cantigen) protein fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                   The inventors claim a cell which contains a gene sequence which encodes protein CD59.CD59 is expressed by the cell and CD59 inhibits complement mediated attack of the cell. The cells fail to elicit T lymphocyte mediated attack or are resistant to complement mediated attack. They can be used to treat patients with immune disorders.
                                                                                                                                                                                                                                                                                                                                              (OKLA-)

                                 Human membrane attack complex inhibition factor (MACIF) regulates the complement system in the final stage of complement activation, and inhibits damage of human cells and tissues as a result of MAC formation. Naturally occuring human MACIF is a glycoprotein of mol. wt. 18 +/- 1 kDa (by SDS-PAGE) with a phosphatidylinositol (PI) anchor at position 76 (Glu) at the C-terminus. When the gene encoding MACIF is expressed in bacteria, the gene (see AAQ98532) gives a modified human MACIF protein comprising 128 amino acid residues (AAR80240); the PI

The 5' ESTs CC different tissues. EST sequences usually correspond mainly to the 3' CC untranslated region (UTR) of the mRNA because they are often obtained CC isolating cDNA sequences derived from the 5' ends of mRNAs and even in CC those cases where longer cDNA sequences derived from the 5' ends of mRNAs and even in CC CC ends and can therefore be used to obtain full length cDNAs and genomic CC chromosome mapping procedures. They are used to obtain and genomic CC chromosome mapping procedures. They are used to obtain upstream cCC regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                        Query Match

```
CC The present sequence is a polypeptide encoded by one of a large number CC of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs CC different tissues. EST sequences usually correspond mainly to the 3' CC untranslated region (UTR) of the mRNA because they are often obtained CC isolating cDNA sequences derived from the 5' ends of mRNAs and even in CC UTR is rarely included. 5' ESTs are derived from the 5' ends of mRNAs and even in CC UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' CC ends and can therefore be used to obtain full length cDNAs and genomic CC chromosome mapping procedures. They are used to obtain upstream cCC regulatory sequences and to design expression and secretion vectors.
Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 13; SEQ ID 7846; 71pp + CD-ROM; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inhibit the formation of the human C5b-9 complex. These mimetics specifically bind to amino acid residues 359-384 of human C9. (11) molecules structurally mimicking C9 amino acids 359-384 when they are in a spatial orientation which can promote the formation of the C5b-9 complex. Compounds that mimic CD59 can be used to increase CD59 inhibition of C5b-9 complex assembly. This is especially useful in patients in need of suppression of complement-mediated inflammation, e.g. immune disorders and diseases such as immunovasculitis, rheumatoid arthritis, scleroderma. Compounds that mimic C9 can be used to promote C5b-9 complex assembly. This is useful in patients in need of complement activation. The composition can be administered as an adjunct to tumour therapy. The present sequence represents a human CD59 (a plasma membrane antigen) arother accuracy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to compounds modulating CD59 mediated complactivity. It provides (1) molecules structurally mimicking human amino acid residues 42-58 (region which serves as binding site for CC9 interactions) when they are in a spatial orientation which can inhibit the formation of the human C5b-9 complex. These mimetics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sims
cell membrane damage
                                    New glyco:protein 1F5 antigen -
derived from human cell membrane, inhibits complement-mediated
                                                                                                                                                                               WPI; 1990-016630/03.

                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Typically it is prepd. from human erythrocytes which are centrifuged and CC the cell membrane fraction suspended overnight in buffer contg. 1% CC n-octyl-beta-D-glucopyranoside (NOG). After centrifugation, the super-central is treated with solid (NH4)2SO4 to 60% sath. After centrifugation cC with a mol. wt. of 20-25 kD. If contains N-glycoside type carbohydrate cc membrane damage. It may be used to generate polyclonal or cc with as principles (Abs) which may be used to determinine cc lymphocytes or other cells, thus enabling the diagnosis of diseases, cc such as pernicious anaemia, rheumatoid arthritis. CC systemic lupus erythematosus and glomerular nephritis. It may be used to treat disorders in which complement archivation is involved. Abs to it can connect consideration of malignant cells. Residues 27-70 are encoded by the polymerase chain reaction (in AAN93318).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Qy

                                             Clone is derived from the Ly-6 cDNA sequence from a human lymphocyte cDNA library. The product may be useful in the study and development of drugs for the treatment of autoimmune diseases and cancer. Probes may also be developed for the isolation of other gene families.

                            Human membrane attack complex inhibition factor (MACIF) regulates the complement system in the final stage of complement activation, and inhibits damage of human cells and tissues as a result of MACI formation. Naturally occuring human MACIF is a glycoprotein of mol. wt. 18 +/- 1 kDa (by SDS-PACE) with a phosphatidylinositol (PI) anchor at position 76 (Glu) at the C-terminus. When the gene encoding MACIF is expressed in bacteria, the gene (see AAQ98532) gives a modified human MACIF protein comprising 128 amino acid residues (AAR80240); the PI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local
                                                                                                                   Human CD59 (AAR86315) is a terminal complement inhibitor protein (CIP) that includes a C-terminal region involved in directing attachment of a glycosyl-phosphatidylinositol (GPI) anchor. A chimeric transmembrane terminal CIP (TMTCIP) comprising amino acids 1-77 of mature CD59 (i.e. lacking the GPI anchor region) and the transmembrane domain (amino acids 270-350) of human CD46, a membrane cofactor protein. The TMTCIP has been expressed on the cell surfaces of the organs of transgenic animals. Such transgenic organs are protected from human complement attack upon transplantation.
                                                                                                                                                                                                                                                                                                                                            Terminal complement inhibitor chimeric protein and nucleic esp. against human complement, useful for protecting cells complement attack e.g. in organ transplantation

                                                               Qy
                                                                                                                                                  This protein sequence comprises human CD59, an inhibitor of complement C55-9 protein. Claimed retroviral vector particles CC express a complement inhibitor such as CD59, and are thereby protected from inactivation upon exposure to body fluids containing CC complement. Also claimed are: (1) a producer cell producing the CC (see also AAW26325) with at least part of the N-terminal receptor-CC (see also AAW26325) with at least part of the N-terminal receptor-CC complement inhibitor activity. The vector is used in a claimed CC method for transducing cells in the presence of a body fluid CC containing complement, preferably ex vivo, especially for gene CC therapy, e.g. of hereditary or acquired blood disorders by containing complement, preferably ex vivo, especially for gene CC transduction of haematopoietic stem cells.
                                                                                     Matches
                                                                                                   Query Match

                                                                                                                                                                                                                                                                                   CC The sequence represents human CD59 protein which is fused to human or CC porcine CTLA4 protein to form CTLA4-CD59 chimeric protein. Chimeric CC proteins comprising a domain having C5b-9 and/or C3 inhibitory activity CC (e.g. CTLA4) and a domain having T-cell inhibitory activity (e.g. CD59) CC immune responses. These polypeptides and their associated nucleic acids CC immune responses. These polypeptides and their associated nucleic acids CC thumoral and cellular rejection after xenotransplantation into humans. The CC sequences are capable of conferring resistance to humoral and cellular CC mechanisms of immune attack, to protect against human serum complement CC and to inhibit T-cell activation. Transgenic animals (for example, CC e.g. pig, goat, sheep) expressing such a chimeric protein on the surfaces of their cells would have a higher chance of survival.

                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The sequence represents a CTLA4-CD59 chimeric protein, formed from human CC CTLA4 protein and human CD59 protein. Chimeric proteins comprising a C domain having C5b-9 and/or C3 inhibitory activity (e.g. CTLA4) and a C domain having T-cell inhibitory activity (e.g. CD59) are capable of inhibiting both cellular immune responses and humoral immune responses. These polypeptides and their associated nucleic acids are useful for protecting pig cells of tissues and organs from both humoral and cellular capable of conferring resistance to humoral and cellular mechanisms of immune attack, to protect against human serum complement and to inhibit T-cell activation. Transgenic animals (for example, rodents, e.g. mouse, capable of capable, e.g. rabbit, hare; and ungulates, e.g. pig, goat, sheep) capacity activation activation on the surfaces of their cells would be a higher chance of survival.
                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                 The sequence represents a CTLA4-CD59 chimeric protein, formed from porcine CTLA4 protein and human CD59 protein. Chimeric proteins comprising a domain having C55-9 and/or C3 inhibitory activity (e.g. CTLA4) and a domain having T-cell inhibitory activity (e.g. CD59) are capable of inhibiting both cellular immune responses and humoral immune responses. These polypeptides and their associated nucleic acids are useful for protecting pig cells of tissues and organs from both humoral and cellular rejection after xenotransplantation into humans. The sequences are capable of conferring resistance to humoral and cellular mechanisms of immune attack, to protect against human serum complement and to inhibit T-cell activation. Transgenic animals (for example, rodents, e.g. mouse, rat; lagomorphs, e.g. rabbit, hare; and ungulates, e.g. pig, goat, sheep) expressing such a chimeric protein on the surfaces of their cells would have a higher chance of survival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chimeric protein useful for protecting xenotransplanted tissues by inhibiting cellular both humoral and immune responses, comprises a C5b-9 and/or C3 inhibitory domain, and a T-cell inhibitory domain
